

Profiler

Standardized company intelligence for the US battery-storage and AI data-center market.

Profiler is the ecosystem's **first-party skeleton** — a research desk that turns public disclosure into a uniform dossier on every company that matters to a BESS/AIDC deal. Every company gets the **same ten sections**, in the same order, sourced the same way, so two companies can actually be compared rather than merely described. Analysis is always labeled as analysis. Sources are always listed. Every prior version is kept.

INSIDE

01 What Profiler does

02 The two-stage research method

Field notes & confidence

Staying current

03 Your workflow & the commands

Getting the most out of it

Who sees what

04 Coverage & the ecosystem

A dossier you can trust twice

The value of Profiler is not that it holds information about companies — it is that the information is *shaped identically* for all 89 of them, and that you can always see where each claim came from.

The dossier — ten standard sections

Open any company and you get the same tabs, in the same order. Nothing is bespoke.

Snapshot

Identity, HQ, ticker, ownership, employees, and the company's role in the ecosystem.

Products & Services

The priority section. Full product-line enumeration with positioning against named competitors, sold-through model, target segments, and dated roadmap.

Technical Specifications

Flagship-product specs — the numbers you would be asked about in a technical conversation.

Recent Developments

Trailing 12–18 months, each event carrying a strategy takeaway rather than a bare headline.

Relationships

Who they supply, buy from, partner with, and compete against — with inbound evidence from other dossiers.

Policy Exposure

Tariffs, credits, domestic-content rules, and the regulatory surface that moves their economics.

Decision Makers

Names, titles, career backgrounds, verified LinkedIn URLs, company-published photos.

Financials vs Expectations

Reported results set against analyst consensus — the honest version, never sourced from the company alone.

Strategy Read

Explicitly labeled analysis. Inference from the sourced facts — never presented as a company statement.

Sources

Every citation, tiered by party. First-party IR/PR first, then filings, then trade press.

Beyond the dossier

SURFACE	WHAT IT GIVES YOU
Roster & search	All 89 companies with a live coverage line — freshness tier, source count, first-party percentage, KPI normalization.
Compare	Companies side by side on the same fields, using only normalized KPIs with denominators stated.
Network explorer	The prebuilt ecosystem graph — 490 relationship edges across suppliers, developers, EPCs, hyperscalers, IPPs, integrators and neoclouds.
Study guides	62 per-company technology curricula with flashcards, quizzes and shared-registry concept tooltips.
Industry Reports	Point-in-time synthesis across the corpus in four types — macro, competitive, risk, opportunity.
Coverage 	Per-company news timeline from Scraper's scored corpus — the dossier read against what happened since.
Field Notes	Private intel capture rated 0–100 for your own confidence. Stored in Drive, never published.
Versions	Every superseded dossier, kept and readable. Nothing is overwritten without an archive.
Export	Dossier or report to Word/PDF, rendered in whichever of five house styles is selected.

Two-stage research, and four rules that never bend

A dossier is only as good as its discipline. Profiler's is written down, applied to all 89 companies identically, and enforced by verification scripts that run before anything is published.

The research protocol

STAGE 1 — FIRST PARTY	STAGE 2 — THIRD PARTY	STAGE 3 — CITE IN ORDER
Exhaust the company's own channels first: investor relations, annual and interim reports, results releases, the full press archive back 24 months, product and datasheet pages, leadership pages.	Fill and check: exchange filings, trade press, consultancy rankings. This supplies what a company cannot credibly say about itself — consensus, independent rankings, litigation, misses.	Company IR/PR/product pages, then filings, then trade press. Figures available only from an aggregator are marked as such rather than quietly promoted.

Products & Services gets the research budget first. Depth is allocated to the full product-line enumeration — names, specs, competitive positioning, roadmaps with dates — before identity and snapshot facts are rounded out. That ordering is deliberate: the product line is what you actually sell against.

THE FOUR STANDING RULES

- **Analysis stays labeled.** Every inference carries a visible tag — *"We assess — analytic judgments from open sources, not company statements."* A reader can always tell fact from read.
- **Notes are not sources.** Your private field notes never appear as a citation and are never blended into a sourced section. They may steer research and shape the strategy read; they can never masquerade as public fact.
- **Expectations honesty.** A "beat" or "miss" verdict is never sourced from the company. Consensus comes from independent coverage or it is not stated.
- **Standard treatment.** Every company gets exactly the standard schema. No bespoke sections, no favourites — which is the whole reason comparison works.

Five house styles, one set of facts

The schema decides *what* a dossier contains; the active writing style decides *how* it reads. Five are registered — **default** analyst prose, **Bloomberg** research-report form, **equity-research** sell-side note, **intel-briefing** (currently active) with confidence-tagged judgments, and **Smart Brevity**. Switching restyles the app, the section labels and the exported document. It never changes the rules above: public sources only, expectations honesty, notes-are-not-sources and labeled analysis apply identically under every style.

Verified, not just written

A profile write is not finished when the JSON is saved. A registry sync reconciles the roster's coverage line from the profile itself, the ecosystem graph is rebuilt so the Relationships tab and Network explorer cannot go stale, the report checker validates every citation and coverage pin, and a role-matrix script asserts that each of the ten gated surfaces still resolves to the right tier. A write that fails any of these is incomplete, not published.

Field notes — your private layer

Everything else in Profiler is public disclosure. Field notes are the one place your own observations live — what a contact said, what you saw at a site, what a competitor let slip. They are stored in Drive behind the access list, never published, and never cited.

Three ways in

- **The in-dossier note box.** Every dossier carries an "Add a Field Note" box with the company already selected. Type it, attach Word or PDF files, save. The write is immediate — no deploy, no commit, no wait.
- **Ask Claude.** `profiler note <Company>: <text>` captures your words verbatim and asks for your confidence rating.
- **Send a document.** Hand Claude a deck or PDF and it extracts the content and writes a faithful summary for the note text; you attach the file itself through the note box.

An existing note can be edited or deleted from the note box's management panel. That is a deliberate asymmetry: **you** may revise your own notes freely, but Claude never alters note text during a triage pass.

Confidence — the number that does the work

Every note carries a 0–100 rating that *you* supply. It is never invented, never defaulted, and never inferred from tone. It decides how the note is used everywhere downstream:

RATING	TREATED AS	WHAT IT IS ALLOWED TO DO
75–100	Reliable first-hand intel	Steers research direction and shapes analysis — the strategy read, prep talking points — stated as your observation.
40–74	A lead	Worth investigating; must be corroborated against public sources before anything leans on it.
0–39	Rumor	Mentioned only with explicit hedging. Never the basis for a conclusion.

Triage — how a note reaches a dossier

Capturing a note never edits a dossier. Promotion is a separate, deliberate decision made during every refresh of that company — or on demand when you say `triage notes`. Each pending note is weighed on three axes: your confidence rating, materiality (would an analyst reading the dossier want this?), and corroboration (does any public source now support it?). The outcome is recorded on the note itself:

Promoted

Folded into the dossier revision — typically as recent-developments context or a line in the strategy read. Always as unsourced context, never dressed up as public fact.

Logged-only

Kept as recall context with no dossier change. Still searchable, still weighted, still yours — it simply did not clear the bar this cycle.

Either way the response tells you which notes were triaged and why, so promotion is never silent.

WHY NOTES ARE QUARANTINED FROM SOURCES

A dossier's credibility rests on the claim that every sourced statement can be traced to a public document. The moment private intel is allowed to blend in unmarked, that claim is false for the whole corpus — and no reader can tell which parts are still safe. Keeping notes structurally separate is what lets the dossier be handed to someone else without caveats.

Staying current without being asked

A research corpus decays. Profiler's answer is not "remember to update it" — it is a set of scheduled jobs that fire on the market's calendar rather than yours, plus a news bridge that keeps every dossier readable against what has happened since it was written.

Refreshes fire on the market's clock

- **Earnings-driven, per company.** Each listed company carries a one-shot trigger set for the day after its scheduled results. The fired session first *verifies the report actually published* — if the company slipped, it reschedules itself and stops rather than writing a dossier from an announcement that does not exist.
- **Self-re-arming.** The last step of every refresh researches the next scheduled report date and arms the following trigger. If the tooling is unavailable it leaves you a reminder instead, naming the expected date. The chain does not quietly end.
- **Staggered.** Companies reporting the same day are spaced two hours apart so parallel sessions never collide.
- **Quarterly sweeps** cover the private and unit-level companies with no earnings calendar — Crusoe, Hithium, FlexGen, Rosendin, Turner, Bechtel, Kiewit, Vantage, QTS and the rest — checking for material developments and refreshing only when something actually moved.

The news bridge

Every refresh reads that company's Scraper timeline since the dossier's last update, plus any pending relationship candidates mined from articles naming two covered companies. Trade press is a citable independent source — unlike a field note — so qualifying items are promoted into recent developments with the article itself as the citation. The discipline that keeps this honest:

Verify at the article

The item is checked against the article itself, not the summary that surfaced it, before anything is written.

Nothing is written back

Items that do not qualify are simply left. Scraper's own reconcile pass tracks them; there is no state to keep in sync.

One outlet is a lead

A single-outlet claim is never promoted as sourced fact. Corroborated and company-confirmed items rank higher.

Relationships are curated

An edge candidate becomes a real relationship only when the article supports one — co-mention is not a relationship.

Nothing is ever overwritten

A revision copies the outgoing dossier into the archive and stamps it with the version being superseded *before* the live file is touched, then records the swap in an archive index. The archive is mirrored off-repo automatically on every merge. The result is a complete, diffable revision trail per company — 193 archived versions and counting — so you can always answer "what did we believe about them in June, and what changed?"

FRESHNESS IS SHOWN, NOT ASSUMED

Every dossier carries its own `lastUpdated` date, and the roster renders it as a tier: **fresh** (≤ 45 days), **aging** (≤ 120 days), **stale**. Reports carry a coverage block pinning each cited company's date and listing the gaps. A stale dossier is never hidden — it announces itself, which is the only way staleness can be acted on.

Your workflow

Two loops run side by side — what you do *in* the app, and what you ask Claude to do *to* the corpus. Most of the value comes from running both.

In the app

- 1

Sign in with Google
The whole app sits behind a sign-in wall gated by the Master ACL. Your role decides which surfaces render.
- 2

Start at the roster, not the dossier
Filter by category, then read the coverage line before you open anything: freshness tier, source count, first-party percentage, whether KPIs are normalized. A stale pin is a signal, not a footnote.
- 3

Read the dossier by tab
Snapshot to orient, Products for the commercial conversation, Technical Specs for the engineering one, Strategy Read for the angle. Hover any jargon for a concept tooltip.
- 4

Check Coverage before a call
The news timeline shows what happened since the dossier was written. This is where a dossier stops being a static document.
- 5

Compare before you position
Put the target next to its two closest peers. Normalized KPIs make the comparison honest and the denominators are stated on the page.
- 6

Export what you need to carry
Word or PDF in the active house style, with a preview so you can check the document before it leaves the building.
- 7

Log what you learned, immediately
Open the note box while the call is fresh. Type it, attach the deck, rate your confidence honestly — that rating is what makes the note useful six months from now.

Asking Claude

SAY THIS	AND YOU GET
<code>profiler <Company></code>	A new dossier researched from scratch, or a revision with the outgoing version archived and the registry, graph and roster all reconciled.
<code>profiler note <Co>: <text></code>	Intel captured verbatim, with a prompt for your 0–100 confidence rating. Instant — no deploy.
<code>profiler prep <Company></code>	A technology lesson plan — not company trivia. Assumes high-school STEM and teaches what their products actually do in their industry.
<code>profiler report <topic></code>	An industry report synthesized from covered dossiers only, citing <i>their</i> sources, with a coverage table that makes staleness visible.
<code>triage notes</code>	A pass over pending notes — each promoted into a dossier or logged, with the reasoning shown.
<code>set profiler style to <name></code>	Switches the house prose style for future authoring and for the app's display.

Reports come in four types — **macro** (state of a topic across the ecosystem), **competitive** (who is winning a peer set and why), **risk** (misses, guidance cuts, litigation, concentration), and **opportunity** (whitespace, roadmaps, unserved segments). Name the type or let it be inferred from how you phrase the ask.

Getting the most out of it

- **Rate notes honestly, not optimistically.** The confidence number is the single input deciding whether a note steers a dossier or gets hedged into a footnote. Inflating it degrades everything downstream — including your own recall of how sure you actually were.
- **Read the freshness pill first.** A dossier last updated 140 days ago is not wrong; it is *old*, and it says so. Ask for a refresh before a meeting that matters rather than trusting a stale pin.
- **Run profiler prep before a first technical meeting.** The dossier tells you what they sell. The prep pack teaches you why it matters in their industry, working backwards from the product to the concept chain. Those are different jobs and the prep pack is the one that survives a hard technical question.
- **Reports are snapshots, not dashboards.** A published report is immutable by design; when the picture changes a new edition supersedes it. That is what lets you show what you believed, and when.
- **The Sources tab is the audit trail.** When a figure is challenged in a meeting, that tab is the answer — and the first-party percentage on the roster tells you at a glance how well-grounded the dossier is before you rely on it.
- **Ask for a batch.** Naming several companies at once runs one research pass each and lands them together, which is far cheaper than six separate asks.

Who sees what

Four tiers, narrowing outward from the desk: everyone admitted reads dossiers, while surfaces that expose private judgment or sensitive synthesis are held closer.

SURFACE	ADMIN	CONTRIBUTOR	ANALYST	VIEWER
Dossiers, roster, search, Policy tab	✓	✓	✓	✓
Study guides + concept tooltips	✓	✓	✓	—
Compare view	✓	✓	✓	—
Relationships tab + Network explorer	✓	✓	—	—
Coverage 📰 (Scraper news bridge)	✓	✓	—	—
Export dossier (Word / PDF)	✓	✓	—	—
Industry Guidance	✓	✓	—	—
Reports · Versions · Field Notes · Style	✓	—	—	—

The note pipeline is enforced server-side, not merely hidden in the UI — a non-admin cannot write a note even by reaching the endpoint directly, and a verification script asserts the whole matrix on every change.

What the corpus holds today

Coverage follows the value chain, not company size — so you can trace a megawatt-hour from the cell that stores it to the hyperscaler that pays for it.

CATEGORY	COMPANIES	WHO THESE ARE, AND WHY THEY ARE COVERED
Suppliers	39	Cell, container, PCS, transformer, switchgear and thermal vendors — the equipment layer.
Developers	12	Originators taking storage and campus assets from site control to commercial operation.
EPCs	12	The firms that actually build the asset and set installed cost.
Integrators	10	Firms wrapping cells and power electronics into a warranted, dispatchable system.
IPPs	9	Independent power producers owning and dispatching generation and storage.
Hyperscalers	7	The end demand. Their capex decisions set the shape of the whole market.
General contractors	5	The data-center builders — the schedule constraint on most AIDC campuses.
Neoclouds	5	GPU-first compute providers reshaping where load lands.

And alongside the dossiers

8 named projects
Flagship campuses and builds tracked as first-class entities that dossiers and lessons can cite.

490 relationship edges
A prebuilt graph regenerated on every profile write, so the Relationships tab is never stale.

Concepts registry
Shared jargon defined once, so a term means the same thing everywhere it appears.

4 industry reports
Point-in-time syntheses across the corpus, each immutable and superseded rather than edited.

Where Profiler sits

PROFILER — THE SKELETON
The durable first-party picture of who everyone is — deeply sourced and comparable across 89 companies.

SCRAPER — THE BLOOD
Fresh third-party news, scored and summarized daily, feeding every refresh with what changed.

CLASSROOM — THE INSTITUTION
Turns both into taught, retained knowledge — tracks, lessons and a weekly briefing.

Each app is useful alone. The compounding comes from one shared corpus, one access model, and one rule: **content flows up the corpus, never down the access ladder**. A tier that cannot see a report in Profiler never meets report-derived material in a Classroom lesson either.

IN ONE LINE
Profiler answers “*who are they, what do they sell, to whom, and how do I know?*” — the same way for every company, every time, with the receipts attached and the previous answer still on file.
